

Abstract of the Disclosure

A computer-driven information management system for coordinating delivery of healthcare services to patients via a communications network, including a server with a database configured to receive and store for retrieval data representing information regarding a patient and collected by a coordinating party from an information source. Data entry means permit the coordinating party to enter the data into the database. A computer communicates with the database via the communications network for processing the data using software downloaded to the server. This permits a requesting party selected from the group consisting of the coordinating party, the patient, a healthcare provider, and an individual authorized to access the data to use the data to coordinate a plan of care for the patient related to treatment of at least one medical condition. A display device displays the data.
